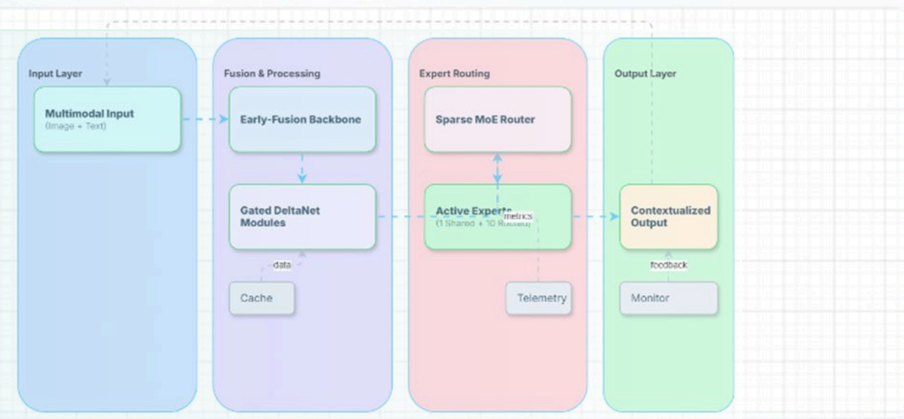
Hybrid MoE + Gated Delta: How it works

- Native multimodal early-fusion backbone: images and tokens processed jointly.
- Gated DeltaNet modules interleave with sparse MoE layers to route specialized computation.
- Router pattern: 512 experts total; typically 10 routed experts plus 1 shared expert activated.
- Design optimizes compute by activating only relevant expert paths for a given input.

Interleaving **Gated DeltaNet** modules with **sparse MoE layers** enables efficient, native multimodal reasoning.



- Achieves best-in-class scores on **IFBench (76.5)** and **MultiC (67.6)**, surpassing GPT 5.2.
